Setup for Windows VISTA

Note the small print: Every computer is different. The following instructions will only work if your computer is equipped with a WPA-capable wireless network adapter and if it is in range of an Emory Unplugged access point. If you are using a different version of the Windows operating system or another software package to manage your wireless card, you may need to reference the instructions that came with your card for information on how to associate your specific wireless card with the Emory Unplugged wireless access points.

Before you begin: Make sure the date and time on your laptop is correct! Also, be sure you have run Windows Update. Vista Patch #KB937123 specifically addresses issues with Windows Vista and wireless connections.

1. Go to your Control Panel and double-click on Network Connections.

2. From the Start menu, click Connect To.

3. Select 'Emory Unplugged' and click Connect.

Your computer will attempt to connect to Emory Unplugged.

4. Select Enter/select additional log on information.

5. Supply your Emory Network ID and password in the box.

Ensure that EMORYUNIVAD is specified as the logon domain. Click OK.

Rev. 07/2007
6 Select **Enter/select additional log on information** again. Then click **OK** to accept the server certificate.

7 Your computer will now attempt to connect to Emory Unplugged.

8 Once you are connected, make sure that **Save this network** and **Start this connection automatically** are checked, and then click **Close**.

9 **You’re finished!** Now when you are within range of an EmoryUnplugged access point, you should connect automatically. No more configuration is needed.
